

ALX System Engineering And Devops - Web infrastructure design

Task 2.

1. For every additional element, why are adding it;
 - 3 firewalls : a firewall for each server allows us to define the network rules for each server to make them secure.
 - An SSL certificate is a bit of code on your web server that provides security for online communications through encryption.
 - 3 monitoring clients allows the administrator(s) to monitor the health and performance of our servers.
 -
2. What are firewalls for; is a network security system that monitors and controls incoming and outgoing network traffic based on predetermined security rules. It basically establishes a barrier between a trusted network and an untrusted network.
3. Why is the traffic served over HTTPS; because it is secured with SSL.
4. What monitoring is used for; it provides the capability to detect and diagnose any web application performance.
5. How the monitoring tool is collecting data; it collects logs of the application server, MySQL Database and Nginx web server. A log in a computing context is the automatically produced and time-stamped documentation of events relevant to a particular system.
6. Explain what to do if you want to monitor your web server QPS; one web server handles 1K queries per second (QPS), I would basically monitor it from the network and application level.

Issues

- A. Why terminating SSL at the load balancer level is an issue; it is an issue because decryption is resource and CPU intensive. Placing the decryption burden on the load balancer enables the server to spend processing power on application tasks but to be honest I don't know see the issue to be honest (I will update this).
- B. Why having only one MySQL server capable of accepting writes is an issue; because once it is down it means no data can be added or updated meaning some features of the application won't work.

C. Why having servers with all the same components (database, web server and application server) might be a problem; this is because once you have a bug in one of the components in one of the servers then the bug will be valid in the other servers.
